                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                              The invention relates to antisense compounds, compositions and methods used for modulating the expression of matrix metalloproteinase 1 (MMP1). Specifically claimed, are antisense oligomucleotides capable of composition the expression of MMP1, and which comprise any of the 55 sequences of 20 bp, fully defined in the specification. The compound, composition and methods are useful for treating a disease or condition associated with MMP1, such as hyperproliferating disease or condition. They are also useful in research and diagnostics for modulating the expression of MMP1. They are also useful in research and diagnostics for modulating the expression of MMP1. They are also useful in research and diagnostics for modulating the antisense compounds can act as MMP1 inhibitors and have the following activities: oyrostatic, antilnflammatory, and antiarteriosclerotic. This polynucleotide sequence represents one of the antisense compounds used for modulating the expression of matrix.

The invention.

the human mdm2 gene. The antisense oligonucleotides which are targeted to useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferation of human cells. The antisense disponucleotides are also useful for treating: hyperproliferative restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Ship-1; SH2-containing phosphatidylinositol phosphatase-1; INPP5D; insensitivity to apoptotic signal; developmental disorder; inflammation; immunosuppressive; autoimmune disorder; antisense therapy; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5

The invention relates to a method of predicting the potential of oligomucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligomucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligomucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict sefficient hybridisation oligomucleotides for each of multiple target sequences therefore very large arrays may be constructed and tested with
                                                                              The present invention provides antisense compounds targetted to nucleic acid molecule encoding Ship-1 (also known as SH2-containing phosphatidylinositol phosphatase-1 and INPPSD) to modulate/inhibit the expression of Ship-1. The invention is useful in treatment of diseases such as insensitivity to apototic signals, autoimmune disorders, developmental disorders and inflammatory disorders. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to
useful for treating diseases associated with expression of Ship-1, such as autoimmune and developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; oligonucleotide hybridisation potential; efficient hybridisation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of predicting the potential of oligonucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligonucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligonucleotides for each of multiple target efficient hybridisation oligonucleotides for each of multiple target minimum synthesis of oligonucleotides. The present sequence represents a HIV PRT antisense derived probe.

The invention relates to a method of predicting the potential of coligomucleotides to hybridise to target mucleotide sequences. The method is useful for predicting the potential of an oligomucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful for efficient hybridisation oligonucleotides for each of multiple target efficient hybridisation oligonucleotides for each of multiple target minimum synthesis of oligonucleotides. The present sequence represents a HIV PRT antisense derived probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to hybridize with target.
                                                                                                                                                                                                               ss; oligonucleotide hybridisation potential; efficient hybridisation;
large array; minimum oligonucleotide synthesis; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.4%; Score 14.8; DB 1; Length 20;

The invention describes a method to identify susceptibility to porcine reproductive and respiratory syndrome virus (PRRSV) in an animal by sasaying a cellular material sample from known origin in the animal for assaying a cellular material sample from known origin in the animals (C D 151; The method is useful to determine the susceptibility of animals (susceptibility pigs) to PRRSV and to compare susceptibility to a known susceptibility standard, especially for material of the same cellular corgin. It can be used to determine if an animal is resistant to PRRSV infection, by determining presence/absence of CD 151, and to classify resistance levels. It is especially useful to select animals for casts of a lower) than a known standard (especially for material of the same cellular origin). Polynucleotides encoding CD 151 are useful to produce vaccines and to modify PRRSV production in cells susceptible to produce vaccines and to modify PRRSV production or 9. in vaccine virus stock. They are especially useful to produce non-simian vaccines, avoiding possible introduction of primate viruses into organs.

CC produce vaccines and to modify PRRSV production e.g. in vaccine virus stock. They are especially useful to produce non-simian vaccines, avoiding possible introduction of primate viruses into organs.

CC produce vaccines production of primate viruses into organs are prescribility factors between individual swine. They can also be used to modulate viral RNA (especially PRRSV RNA) entry into cells by altering CD 151 amounts in cells. Polynucleotides may be included in plasmide useful to render a cell lines susceptible. They was the conducte and used to integrate CD 151 into a chromosome.

CC alls by altering CD 151 amounts in cells. Polynucleotides may be included in vectors and used to integrate CD 151 into a chromosome. They can also be used to produce transformed cell lines, useful or induction in order to determine sequence of a porcine CD 151 into in order to determine the corder and used to bit integrate substa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 17; SEQ ID NO 13; 45pp; English.

Microsatellite markers based on hypervariable genomic fragments, from
Triticum aestivum (wheat) or the tribe Triticeae, consist of a sequence
C tagged site (STS), defined by 2 specific primers (of mean size 17-23
C bases) that flank a microsatellite sequence at both ends, which can be
amplified to polymorphisms (PCR products of different sizes). The
CC microsatellites are n-fold tandem repeats (n = 10 or more) of di-, triCC retraploid forms of which individual bases are mutated. The
CC microsatellite markers can be used for genetic analysis of hexaploid and
CC microsatellite markers can be used for genetic analysis of hexaploid and
CC c microsatellite markers can be used for their selection; for
CC morogenic and polygenic properties, and for their selection; for
CC monogenic and polygenic properties, and for their selection; for
CC analysing relationships and identifying varieties; and for evaluating
CC varietal purity, hybrid identification and plant growth. The markers can
Cdifferentiate between almost all Buropean wheat lines and show a higher
CC degree of DNA polymorphism than known probes for the wheat genome. They
CC an be detected by PCR, so large numbers of samples can be analysed
CC and be detected by PCR, so large numbers of samples can be analysed

Exon 2 of an ENaC subunit amplifying forward primer B-2.

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12397). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulnemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary hammaglobulabrand's disease, tuberous selerosis, hereditary hammar diseases, on Milabrand's disease, tuberous selerosis, hereditary hammar diseases, inflammario, acute intermittent porphyria, syndrome, osteogenesis imperfecta, acute intermittent porphyria, syndrome, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (eg. baldness, obesity), strength, speed, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; Gaps New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease. .; 0 Score 14.8; DB 1; Length 21; Pred. (VARI-) VARIAGENICS INC.

```
Sequences shown in AAV57601 to AAV57686 represent primers used for the PCR amplification of the exons of the different subunits of the human epithelial sodium channel (ENAC) gene. This is used in the method of the invention of determining the presence or absence of a mutation conferring a pathological condition mediated by altered ion transport. The method comprises analysing a nucleic acid sample, or protein sample, for the presence of a mutation in the ENAC gene, or in its encoded protein. A vector containing a nucleic acid encoding a human altered variant of the ENAC protein can be used to transform host cells to produce an altered variant of an ENAC protein. The protein can be used to identify agents that effect ion transport. The agonists can be used to treat pathological conditions resulting from abnormal ion transport, such as water retention, increased blood pressure, chronic respiratory and metabolic

This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene viteal for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a percancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms present in the present in a population and targets only one allelic form present in the cused in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic centors, benigh tumours, endometriosis, polycystic kindrey disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent thuman polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

This invention describes a novel method for identifying an inhibitor on a gene vital for creatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LCH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene specific inhibitor of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene comman somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosalerotic plaques, premalignant metaplastic or dysplastic cancers, benign tumours, endometricals, polycystic kidney disease, and graff versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZSSB12-ZZSB25 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                       Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                           The invention identifies a genetic locus ASTH1, associated with asthma, mapped to human chromosome 11p. ASTH11 and ASTH1J are genes present within the locus, located close to each other on human chromosome 11p, and have similar patterns of expression, and common sequence motife. The ASTH1 genes and fragments, encoded protein, genomic regulatory regions and anti-ASTH1 antibodies are useful in the identification of individuals predisposed to development of asthma, and for the modulation of gene activity in vivo for prophylacitic and therapeutic purposes. The ASTH1 protein is useful as an immunogen to raise specific antibodies, in drug screening for compositions that minic or modulate ASTH1 activity or expression, including altered forms of ASTH1 protein, and as a therapeutic. Sequences AAZ18366-Z18509 represent polymorphisms in the
                                                            genes, useful for diagnosis of a predisposition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel biallelic markers used to construct a high density disequilibrium map of the human genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAZ65654 to AAZ69578 represent human biallelic markers from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human biallelic marker downstream amplification primer SEQ ID NO:10297.

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haploryping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which are associated with a genetic predisposition to asthma and bronchial hyperreactivity. The ASTH1J and ASTH1J genes are oriented in opposite directions with the ASTH1 locus, and have similar patterns of expression and common sequence motifs. They are both expressed in trachea, lung and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acids other than naturally occurring chromosomes encoding ASTHI protein, for e.g. screening compositions that modulate expression or function of ASTHI proteins or as diagnostics for genetic predisposition to asthma.
                                                                                                                                                                                                                                                                                                                                                                                Gaps

family of transcription factors, which have been implicated in the cativation of a variety of genes including the TCRa gene and cytokine activation of a variety of genes including the TCRa gene and cytokine genes known to be important in the actiology of asthma. Both ASTHII and ASTHII mansoripts has no effect on the open reading frame of ASTHII and atternative splicing of ASTHII to the start codon in exon b. In contrast, atternative splicing of ASTHII transcripts results in 3 different ASTHII isoforms. The invention also encompasses mouse asthij protein. The ASTHII isoforms. The invention also encompasses mouse asthij protein. The ASTHII isoforms. The invention also encompasses mouse asthij protein. The ASTHII isoforms are useful as diagnostics to identifying ASTHII related genes, for identifying expression of the gene in a biological specimen, and for generating genetically modified non-human animals or site specific gene modifications in cell lines. The encoded ASTHI proteins are useful as immunogens to raise specific antibodies; in drug screening for modifications that minic or modulate dorms of these proteins; and as a thrapeutic. The ASTHII genes or fragments thereof, encoded proceins, ASTHII genomic regulatory regions, and anti-ASTHII and anti-ASTHII antibodies are useful in the identification of individuals predisposed to development of asthma, and for modulation of gene activity in vivo for prophylactic and therapeutic purposes. The intact ASTHII or ASTHII processing the proteins or active fragments thereof may be used to modulate or reduce processing the processing and applications of proteins or activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparing metal oxide support loaded with biomolecules, useful in prok based assays, comprises activating the support by a silanating agent comprising an amine group and attaching biomolecules to the activated

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism;

The method comprises activating the support with a silanating agent with an amine group and loading the support by attaching biomolecules to the activated surface. The loaded support is treated with an acidic solution provided that it is not used for preparing silica wafers which are aminated by silanation using (3-aminopropy) monocthoxydimethylsilane and loaded with oligonuclectides. The metal oxide support is useful in performing a probebased assay. Metal oxide supports are further useful for carrying biomolecules, e.g. for use as vaccines, and for separating other substances from mixtures by hybridising, binding or interacting otherwise with those other substances. The present sequence is an oligonucleotide used in the present invention

DNA sequences AAH62100 - AAH6268B represent segments of human genes which the invention for analysing a nucleic acid sample, A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of medicament for the treatment or prophlaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drug-resistance; succinate dehydrogenase Ip subunit; fungus; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for selecting a target polynucleotide. The method comprises introducing into a host cell population a library of insert polynucleotides, where expression of the target polynucleotide directly or indirectly promotes host cell death. The cells are cultured and the insert polynucleotides are collected from the cells which die. The method is useful for selecting target polynucleotides, particularly polynucleotides which alter cell phenotypes of induce or inhibit cell death. The method can be used to isolate toxic genes such as tumour suppressors. The present sequence is a PCR primer, which was used in an example from the present invention

                                                                                                                                                                                                                         This invention relates to a drug resistance gene derived from a fungus forming fruit body. Included in the invention are a vector containing the drug-resistance gene, and a fungus forming fruit body into which the vector is introduced. The vector can be used for improving grades of fungi. The present sequence represents PCR primer used in the course of the invention for the identification of the drug resistance gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; skin disease; proliferation retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MWP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar;

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [1] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, dermatclogical, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing prematurity and retinal detechment, and for treating and preventing scar. AAH$2757 to AAH$6209 represent sequences used in the scar. AAH$2757 to AAH$6209 represent sequences used in the constitution of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The present invention provides the protein and coding sequences of fatty acid transport proteins (FATPs) from a number of species, including PATP1. FATP2. FATP3, FATP5 and FATP6 from the human, FATP1-FATP5 from the mouse, FATP3 and b from C. elegans, and FATP from Aspergilus tuberculosis and Cochliobolus heterostrophus. The FATP from Mycobacterium tuberculosis can be used to identify inhibitors which can then be used to treat TB. That from M. grisea (also known as rice blast fungus) can be used to develop anti-fungal agents capable of preventing infection of diabetes, heart disease, obesity, hyperlipidaemia and weight control. The present sequence is one of the sequences described in the exemplification

cc polypeptide, introducing into the host cell a library of polynucleotides encoding the polypeptides, permitting expression of the polypeptides and chen recovering them from the host cells. The transcriptional regulatory region is operably associated with a polynucleotide encoding a gene product, the expression of which results in host cells death or cause the host cells to exhibit a pre-determined modified phenotype and where the gene product is expressed upon activation of target transcriptional regulatory region. Each candidate regulator polypeptide and where cc candidate peptide is displayed on the surface of the candidate regulator confidere peptide. The methods are useful in selecting and/or screening correctled. The methods are useful in selecting and/or screening corpuspential regulatory region in a eukaryotic host cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Regulator; transcription, cell death; phenotype; molecular scaffold; gene therapy; cancer; cardiovascular disease; arrhythmia; heart failure; ischaemia; obesity; neurodegenerative disease; Alzheimer's disease; acone pathology; dermatologic disease; psoriasis; infection; AIDS; acquired immunodeficiency syndrome; cosmetic; wound healing; primer; antibiotic transport; drug toxicity; drug resistance; immunobiology; inflammation; allergic response; human immunodeficiency virus; ss; PCR.
                                                                                                                                                                                                                                                          The present invention relates to probes which can be used for the measurement of an enzyme. The probes can be used for the measurement of an enzyme participating to the first phase reaction of drug metabolism. The present sequence is a probe shown in the invention
                                                                                                                                            Measurement of an enzyme participating to the first phase reaction of drug metabolism, a probe and a kit for it.

```

The invention discloses a method for identifying polynucleotides encoding a regulator polypoptide, whose expression induces activation of a target transcriptional regulatory region in a host cell. The method comprises providing a population of eukaryotic host cells capable of expressing the

```
The invention relates to selecting polymucleotides which encode antigen specific immunoglobulins (1g) (or fragments) comprising introducing into specific immunoglobulins (1g) (or fragments) comprising introducing into a population of host cells, a lst and 2nd library of polymucleotides can early/late encoding, several lst and 2nd lseubunit polypeptides, permitting expression of Ig molecules with an antigen, and recovering component, contacting Ig molecules with an antigen, and recovering polymucleotides of the lst library for the antigen. The Ig molecules are heavy and light chain constant regions and variable regions linked via peptide linkers and optionally directed via signal peptides or transmembrane domains to different cell compartments. Also included is a method of selecting polymucleotides which encode a single-domain antigen-specific Ig molecule (its anti-specific fragment), by: (a) introducing into a population of eukaryotic host cells capable of expressing the Ig colecule a library of polymucleotides encoding (through operable of association with a transcriptional control region) several single-domain Ig polympetides (each comprising a Ig heavy chain constant region, a camelised Ig heavy chain variable region, and a signal peptide capable of directing cell surface expression or secretion of Ig subunit polympetides (cf ragments) from the host cells; (c) contacting the Ig molecules with an antigen; and (d) recovering polymucleotides of the library from those constitutes with an encode an antigen specific Ig molecule, or its fragment. The present sequence is a PCR primer used in the method of the images.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
Selecting polynucleotides which encode antigen-specific immunoglobulin molecules, by introducing the library of polynucleotides into the host cells, and recovering the polynucleotides of the library for the antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention provides the protein and coding sequences of the ferroportin 1 (SLC11A3) gene, and describes the A734C base change present in the gene which causes hereditary haemochromatosis (HH). This affects SLC11A3 mediated iron transport. The sequences can be used in the diagnosis and treatment of hereditary haemochromatosis and anaemia. The present sequence is a PCR primer used to isolate the sequences in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identification; intrabody; eukaryotic cell; immunoglobulin; selection; cardiovascular; diminished arrhythmia potential; cardiomyocyte; stroke; enhanced contractile property; heart failure; arrhythmia; embolic; sarcolemmal calcium cycling; artery; arteriole; angina; atherosclerosis; LDL metabolism; HDL metabolism; skin biology; keloid formation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Selecting polynucleotides encoding an intracellular immunoglobulin which induces a modified phenotype in a eukaryotic host cell, by introducing library of polynucleotides encoding immunoglobulin subunit polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for selecting polynucleotides (PNs) encoding an intracellular immunoglobulin molecule or its fragment
                                   New isolated DNA sequence and polypeptide, useful for diagnosing a patient as having an increased risk of developing hereditary hemochromatosis disease or anemia, or screening potential therapeutic
                                                                                                                                                                                                                                                                                                                                                                           Gaps

Preparation of dendritic cells, useful in a vaccine or a pharmaceutical composition for the prevention and/or treatment of infectious or neoplastic disease, comprises culturing mononuclear cells in a medium with type I interferon.

Example 2; Page 37; 91pp; English

The sequences given in ABA00724-33 are primers which were used in RT-PCR to determine whether dendritic cells treated with interferon (IFN) / granulocyte/macrophage-colony stimulating factor (GM-CSF) exhibited any specific pattern of cytokine expression as compared to cells cultured in the presence of interleukin-4 (IL-4)/GM-CSF. The dendritic cells used were the cells of the invention which were prepared by culturing mononuclear cells in a culture medium containing type I IFN, where the monouclear cells are total peripheral blood mononuclear cells (PBMCS), adherent PBMCs and highly purified CD14+ monocytes isolated from PBMCs. The dendritic cells are useful for the preparation of a vaccine or a pharmaceutical composition for the preparation of a vaccine or pathology associated with the presence of an antigen in the human body. The pathology is an infectious or neoplastic disease. The infectious disease is a viral infection, preferably HIV, HBV or HCV infection. The propagatic disease is lymphoma, and virally induced, preferably by an Epstein-Barr virus

Diagnosing bipolar disorder (BP) or susceptibility to BP in an individual comprises determining and analyzing single nucleotide polymorphisms in the cytoplasmic antiproteinase 2 gene of the individual.

Example 1; Page 24; 46pp; English.

The invention relates to diagnosing bipolar disorder (BP) or susceptibility to BP in an individual. The method involves determining, in a sample from the individual, the single nucleotide polymorphism (SNP) in the cytoplasmic antiproteinase 2 (CAP2) gene of the individual and determining the status of the individual by reference to polymorphism in the CAP2 gene. The method is useful in diagnosing bipolar disorder, or susceptibility to this disorder, in an individual. Sequences ACC006603-10 represent PCR primers for sequencing the human CAP2 CDNA

The invention relates to methods and arrays suited to correct for signal errors due to variation in sample preparation. Methods and compositions for performing quantitative array-based assays are provided. A reporter and an analyte are used, where the reporter binds selectively to an internal reference present on the array, i.e. at least a subset, if not all, of the spots present on the array used in the method contain an internal reference which can be bound by the reporter. The method is useful for the identification of an analyte in a blological sample, particularly for use in expression profiling assay, genotyping, sequence determination by hybridisation, gene quantitation, gene abnormality analysis (MAPH), PCR,

The present sequence is that of an HIVpol7p41 target sequence for a set of 11 specific receptors (probes) (see ACC84382-92) that were spotted on an array and used in normalization of a Pamchip assay in an example of the method of the invention. The invention relates to methods and arrays suited to correct for signal errors due to variation in sample preparation. Methods and compositions for performing quantitative array-based assays are provided. A reporter and an analyte are used, where the reporter binds selectively to an internal reference present on the array, at least a subset, if not all, of the spots present on the array used in reporter. The method contain an internal reference which can be bound by the reporter. The method is useful for the identification of an analyte in a biological sample, particularly for use in expression profiling assay, gene abnormality analysis (MAPH), PCR, NASBA or TYRAS (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identification of analyte in biological sample, involves determining signal of reporter molecule binding to internal reference, determining signal of analyte binding to receptor, and normalizing signals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                              HIVpol7p41 target sequence, for normalization of PamChip assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Unidentified

```
The present sequence is that of HIVpol7p41-4, a specific receptor (probe) used in an array system to detect a target sequence (see ACC84393). This sequence has on mismatches with the target. It is one of a set of 11 secretic receptors (see ACC84382-92) used in normalization of a penchip assay as an example of the method of the invention. The invention relates to methods and arrays suited to correct for signal errors due to variation in sample preparation. Methods and compositions for performing quantitative array-based assays are provided. A reporter and an analyte present on the array, at least a subset, if not all, of the spots present on the array used in the method contain an internal reference which can be bound by the reporter. The method is useful for the identification of an analyte in a biological sample, particularly for use in expression profiling assay, genotyping, sequence determination by hybridisation, gene abnormality analysis (MAPH), PCR, NASBA or TYRAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identification of analyte in biological sample, involves determining signal of reporter molecule binding to internal reference, determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         signal of reporter molecule binding to internal reference, dete signal of analyte binding to receptor, and normalizing signals.
                                                                                         Probe HIVpol7p41-4 used in normalization of PamChip assay.

Bcr-abl fusion gene RNA interference sequence S2.

Tyrosine kinase inhibitor; mutant tyrosine kinase; RNA interference; bcr-abl fusion gene; antisense; cytostatic; myeloid leukaemia; lymphatic leukaemia; myeloblastic leukaemia; ds.

Increasing activity of inhibitor of a tyrosine kinase, useful in treatment of leukemia, by RNA interference inhibition of gene expression. The present invention relates to a method of increasing the activity of an inhibitor of the activity of a tyrosine kinase, the product of a mutant gene, comprising inhibiting expression of the mutant gene by RNA interference. The method is used to treat chronic myeloid, acute lymphatic and acute myeloblastic leukaemias. The present sequence is an RNA used in the inhibition of a bor-abl fusion gene in the Gaps Aulitzky W; ; 0 Match 0.4%; Score 14.8; DB 1; Length 21; Local Similarity 72.2%; Pred.                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 3, Application US/08076090
Patent No. 5631162
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Lendon, Irving M.
APPLICANT: London, Irving M.
APPLICANT: Tuan, Dorothy
TITLE OF INVENTION: Retroviral Vectors for Transducing
TITLE OF INVENTION: Beta-Globulin Gene and Beta-Locus Control Region
TITLE OF INVENTION: Derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-07-98-289B-14/C

Sequence 14, Application US/07998289B
Patent No. 6027876
GENERAL INFORMATION:
APPLICANT: Black, Bruce C
APPLICANT: Taylor, Martin
APPLICANT: Heckel, David G
TITLE OF INVENTION: Method for Monitoring Pesticide
TITLE OF INVENTION: Resistance
NUMBER OF SEQUENCES: 40
CORRESPONDENTS ADDRESS:
ADDRESSEE: Darby & Darby PC
STRIE: 805 Third Avenue
STATE: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       OPERATING SYSTEM: PC-LUCS/MS-LUCS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 54, Application US/09657452A

Patent No. 642618

GENERAL INFORMATION:
APPLICANT: Brett P. Monia
APPLICANT: Jacqueline Wyatt
TITLE OF INVENTION: ANTISENSE MODULATION OF PHOSPHORYLASE KINASE ALPHA 1 EXPRESSION
TITLE REFERENCE: RTS-0125
CURRENT APPLICATION NUMBER: US/09/657,452A
CURRENT FILING DATE: 2000-09-07
NUMBER OF SEQ ID NOS: 178
SEQ ID NO 54
LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

Sequence 24, Application US/08890719A

Patent No. 6075125

GRNERAL INFORMATION:
APPLICANT: Bacon, Larry D

APPLICANT: Fulton, Janet

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: Production of Antisera Specific to Major

TITLE OF INVENTION: 1945compatibility Complex Molecules in Chickens

FILE REFERENCE: 1977-07-09

CURRENT FILING DATE: 1977-07-09

EARLIER PILING DATE: 1996-07-10

NUMBER OF SEQ ID NOS: 39

US-09-042-785A-14

Sequence 14, Application US/09042785A

Patent No. 6194151

GENERAL INFORMATION:

APPLICANT: Busfield, Samantha J

TITLE OF INVENTION: NOVEL MOLECULES OF THE TNF RECEPTOR SUPERFAMILY

TITLE OF INVENTION: AND USES THEREFOR

NUMBER OF SEQUENCES: 31

CORRESPONDENCE ADDRESS:

CORRESPONDENCE ADDRESS:

STREET: 28 State Street

CITY: Boston

STATE: Massachusetts

COUNTRY: USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US-09-071-433-26

US-09-071-433-26

Second 26, Application US/09071433A

Patent No. 6197584

GENERAL INFORMATION:

APPLICANT: Benefit, C. Frank

APPLICANT: Cowsert, Lex M

TITLE OF INVENTION: Antisense Modulation of CD40 Expression

TITLE OF INVENTION: Antisense Modulation of CD40 Expression

CURRENT APPLICATION WUMBER: US/09/071,433A

CURRENT FILING DATE: 1998-05-01

NUMBER OF SEQ ID NOS: 91

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 26

LENGTH: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 14.8; DB 1; Length 18;

Sequence 193, Application US/09249730

Patent No. 6121000

GENERAL INFORMATION:

APPLICANT: WRIGHT, Jim A.

APPLICANT: YOUNG, Aiping H.

TITLE OF INVENTION: Antitumor Antisense Sequences Directed Against R1 and
TITLE OF INVENTION: Accomponents of Ribonucleotide Reductase

FILE REFERENCE: 032396-040

CURRENT FILING NUMBER: US/09/249,730

CURRENT FILING DATE: 1999-02-11

NUMBER OF SEQ ID NOS: 220

SOFTWARE: PatentIn Ver. 2.0
